
Supplementary Figure S5. Gene Ontology (GO) enrichment analysis of *A. thaliana* homologs of *A. arenosa* paternally expressed genes (PEGs). *A. thaliana* GO categories and genome was used as background. Annotation data sets used were Molecular function (MF), Biological Process (BP). No significant enrichment was found for PEGs using the Cellular component (CC) annotation set. Numbers next to the points in plot represent the Odds enrichment ratio. Size of the point reflects the number of genes in the test list and Gene Ratio the fraction of total test list. Adjusted p-values reflect significance from Fisher's exact test with Benjamini Hochberg correction for multiple testing.
