Supplementary Figure S7. Phylogenetic representation of the F-box family in *A. arenosa* and *A. thaliana*. Maximum-likelihood tree of F-box domain sequences. Coloured boxes indicate predominant C-terminal motif. Tip colours denote imprinting status, with PEGs in blue and MEGs in orange. Diamonds on branches represent support values (UFboot/SH-aLRT): black diamonds indicate high support (>95/80), and grey indicates moderate support (90–95 / 70–80). When only one support value exceeds the threshold, the other is shown as "-". Branches without a displayed diamond or value received no support above the reporting thresholds. Scale bar indicates the number of substitutions per site.
